

Priority #4 – Decarbonisation and Energy transition

Priorities

Description

Accelerate adoption of new technology; foster consistent decarbonisation metrics and reporting

Approach + Resource model

Initiatives

- A** Foster adoption of common decarbonisation metrics and calculation methods (for example ISSB) across state and federal boundaries
- ALC to establish a Sustainability taskforce to determine priorities to effectively and quickly progress towards 'net zero' goals – realistic and attainable, measurable and specific
 - Investigate the design landscape (government and industry)
 - Assess the suitability of existing metrics in the market (Carbon and Nitrous Oxide)
 - If yes , promote and facilitate industry adoption; if no, then engage the appropriate industry body to guide design
- B** Establish a unified voice for the industry back to Government to provide clear guidance on the preferred approach including the use of rail and modal shift, that can be echoed consistently from multiple member organisations
- EV / Hydrogen policy
 - Vehicle standards
 - Associated infrastructure
 - Modal shift
 - Align messaging for the immediate opportunities as well as the short to long term requirements
 - Map the priority sequence of deliverables that are realistically possible for government and industry to achieve
 - Share the information as broadly as possible through major events, media and publications
